

# Introduction to LaTeX

A document preparation system

**V. Sasi Kumar**

*Free Software Foundation of India*

*Prepared using LaTeX*

**L<sup>A</sup>T<sub>E</sub>X** is a document preparation system

It helps you to:

- typeset a document
- create ToC, table of figures, index, etc.
- create good-looking equations
- cite references properly and list them
- manage cross-references

and more ...

**L<sup>A</sup>T<sub>E</sub>X is not an application, like a Word processor**

**L<sup>A</sup>T<sub>E</sub>X** is not an application, like a Word processor

It is more like a programming language

L<sup>A</sup>T<sub>E</sub>X is not an application, like a Word processor

It is more like a programming language

You prepare a text file and then compile it

L<sup>A</sup>T<sub>E</sub>X is really a set of macros for the T<sub>E</sub>X system created by Prof. Donald Knuth

L<sup>A</sup>T<sub>E</sub>X was created by Leslie Lamport

There are other similar systems also, such as ConT<sub>E</sub>Xt, X<sub>e</sub>T<sub>E</sub>X and LuaT<sub>E</sub>X.

**L<sup>A</sup>T<sub>E</sub>X** files are simply text files with commands  
embedded along with the content

L<sup>A</sup>T<sub>E</sub>X files are simply text files with commands  
embedded along with the content

L<sup>A</sup>T<sub>E</sub>X could also be compared to a Markup language  
like HTML

L<sup>A</sup>T<sub>E</sub>X files are simply text files with commands  
embedded along with the content

L<sup>A</sup>T<sub>E</sub>X could also be compared to a Markup language  
like HTML

Let us look at a sample document .....

Here is how we can write a simple L<sup>A</sup>T<sub>E</sub>X file:

```
\documentclass[a4paper,12pt]{article}
```

```
\begin{document}
```

The true spirit of delight, the exaltation, the sense of being more than man, which is the touchstone of the highest excellence, is to be found in Mathematics as surely as in poetry...

```
\end{document}
```

**Let us save this file as, say, `mydoc.tex`**

Let us save this file as, say, `mydoc.tex`

We can then compile this file using the command

Let us save this file as, say, `mydoc.tex`

We can then compile this file using the command

```
latex mydoc.tex
```

Let us save this file as, say, `mydoc.tex`

We can then compile this file using the command

```
latex mydoc.tex
```

The result will be a file called `mydoc.dvi`

The .dvi file can be converted to a postscript or pdf file using simple commands.

Alternatively, we could simply do

```
pdflatex mydoc.tex
```

and get a pdf file.

**A L<sup>A</sup>T<sub>E</sub>X document normally has two parts:**

1. a preamble — what comes before the `\begin{document}` command
2. the body — what comes between `\begin{document}` and `\end{document}`

The preamble contains document specifications and list of packages used. Example:

```
\documentclass[a4paper,12pt]{article}
\usepackage[hmargin=1in,vmargin=1in]{geometry}
\usepackage{color}
\usepackage{graphicx}
\usepackage{fancyhdr}
\cfoot{}
\rhead{\thepage}
```

Packages make it easier to do things.

Packages make it easier to do things.

For instance, the geometry package makes it easy to set margins:

```
\usepackage [vmargin=2cm,hmargin=1in] {geometry}
```

## There are several document classes:

- article
- report
- book
- letter
- beamer (for presentations)

**There are several document classes:**

- article
- report
- book
- letter
- beamer (for presentations)

..... and so on. And one can create one's own class too.

**There are several document classes:**

- article
- report
- book
- letter
- beamer (for presentations)

..... and so on. And one can create one's own class too.

Each has its own features.

**L<sup>A</sup>T<sub>E</sub>X** commands start with a backslash (`\`). They are of the form:

```
command [options]{arguments}
```

**L<sup>A</sup>T<sub>E</sub>X** commands start with a backslash (`\`). They are of the form:

```
command [options]{arguments}
```

**For example:**

```
\includegraphics[scale]{path/filename}
```

Just as in a programming language, there are special characters in L<sup>A</sup>T<sub>E</sub>X too. These are:

\	backslash, used for commands
{ }	braces, used for command arguments
%	percent, to mark comments
\$	dollar sign, to denote math typesetting
^	math superscript
_	math subscript
&	ampersand, to separate columns in tables
#	hash, macro parameters
~	non-breaking space

Just as in a programming language, there are special characters in L<sup>A</sup>T<sub>E</sub>X too. These are:

\	backslash, used for commands
{ }	braces, used for command arguments
%	percent, to mark comments
\$	dollar sign, to denote math typesetting
^	math superscript
_	math subscript
&	ampersand, to separate columns in tables
#	hash, macro parameters
~	non-breaking space

**They cannot be used directly in the body**

To get these characters in your L<sup>A</sup>T<sub>E</sub>X document, use:

To get:	Use:
\	<code>\textbackslash</code>
}	<code>\{ \}</code>
%	<code>\%</code>
\$	<code>\\$</code>
^	<code>\textasciicircum</code>
-	<code>\-</code>
&	<code>\&amp;</code>
#	<code>\#</code>
~	<code>\textasciitilde</code>

**L<sup>A</sup>T<sub>E</sub>X** is especially good for structured documents. It supports commands like

- `\part`
- `\chapter`
- `\section`
- `\subsection`

depending on the documentclass

**L<sup>A</sup>T<sub>E</sub>X** uses *environments* for different purposes:

- lists
- quotations
- figures
- tables
- equations

Environments begin with a `\begin` command and end with an `\end` command:

```
\begin{tabular}{r|lp{3cm}}
  \hline\hline\\
  & {\bf Planet} & {\bf Atmosphere}\\
  \hline \hline
  1 & Mercury & No atmosphere\\
  2 & Venus & Heavy atmosphere \\
  \hline\hline
\end{tabular}
```

This is how the table would look

<b>No.</b>	<b>Planet</b>	<b>Atmosphere</b>
1	Mercury	No atmo- sphere
2	Venus	Heavy atmosphere

## Long Table

A table like this will not flow beyond a page

If you need a table that goes beyond a page,

you need to use a `longtable`

The `Figure` environment is another example:

The Figure environment is another example:

```
\begin{figure}  
\includegraphics[scale=scale]{\path\filename.ps}  
\caption{This is the figure caption.}  
\end{figure}
```

To insert a graphics file in your document, add the statement `\usepackage{graphicx}` in the preamble and use the command `pdflatex <filename>` to directly get a pdf file. In this case, you can use graphics files in different formats, such as jpeg, png, pdf, etc.

A L<sup>A</sup>T<sub>E</sub>X document can be created using any text editor.  
But, there are editors that facilitate this. Examples are:

A L<sup>A</sup>T<sub>E</sub>X document can be created using any text editor. But, there are editors that facilitate this. Examples are:

### GNU/Linux:

- GNU Emacs
- Kile
- Gedit
- T<sub>E</sub>Xmacs

A L<sup>A</sup>T<sub>E</sub>X document can be created using any text editor. But, there are editors that facilitate this. Examples are:

**GNU/Linux:**

- GNU Emacs
- Kile
- Gedit
- T<sub>E</sub>Xmacs

**MS Windows:**

- WinEdit

This is just an introduction to basic L<sup>A</sup>T<sub>E</sub>X .

There is a lot more to learn

But, hopefully, you will find it interesting and convenient as we move on

In the next sessions, we will see how to create lists and boxes, prepare question papers and write mathematics in L<sup>A</sup>T<sub>E</sub>X like the statement:

Thus,  $\lim_{x \rightarrow \infty} \int_0^x \frac{\sin x}{x} dx = \frac{\pi}{2}$  and so, by definition,

$$\int_0^{\infty} \frac{\sin x}{x} dx = \frac{\pi}{2}$$

**Thank You**

**Merci**

**Danke**

**Grazie**
